

Name: \_\_\_\_\_

1. (1 pt.)

- **Read all material carefully.**
- *If in doubt whether something is allowed, ask, don't assume.*
- You may refer to your books, papers, and notes during this test.
- E-books may be used *subject to the restrictions* noted in class.
- Computers are not permitted, except when used strictly as ebooks.
- Network access of any kind (cell, voice, text, data, ...) is not permitted.
- Write, and draw, carefully. Ambiguous or cryptic answers receive zero credit.
- Use class and textbook conventions for notation, algorithmic options, etc.

Write your name in the space provided above.

|   |
|---|
| WAIT UNTIL INSTRUCTED TO CONTINUE TO REMAINING QUESTIONS. |
|---|

Do not write in the following table.

| Q     | Full Score |
|-------|------------|
| 1     | 1          |
| 2     | 9          |
| 3     | 10         |
| 4     | 15         |
| 5     | 15         |
| 6     | 10         |
| total | 60         |

2. (9 pts.) For the following mapping of rod lengths to prices, how many recursive invocations of CUT-ROD does the *recursive top-down cut-rod algorithm* make, when invoked with the following array  $p$  and  $n = 12$ ? *Provide an exact numerical answer along with an explanation.* [Hint: You do not need to solve the cut-rod instance.]

|         |   |   |   |    |    |    |    |    |    |    |    |    |
|---------|---|---|---|----|----|----|----|----|----|----|----|----|
| length: | 1 | 2 | 3 | 4  | 5  | 6  | 7  | 8  | 9  | 10 | 11 | 12 |
| price:  | 4 | 7 | 9 | 14 | 18 | 22 | 30 | 30 | 28 | 38 | 40 | 44 |

3. (10 pts.) Solve the following recurrences. *Clearly state the methods you use for your solutions and outline their key steps.* (Show your work.)

(a)  $T(n) = 2T(n/2) + 13n + 3$

(b)  $S(n) = 7S(n/2) + 8n^{1.75}$

[additional space for answering the earlier question]

4. (15 pts.) Trace the operation of the LCS-LENGTH algorithm on the following sequences.

A C B A A B A  
C B A C A A B

Depict the state of the  $b$  and  $c$  arrays (1) after four iterations of the outer nested loop and (2) at the end of the algorithm.

[additional space for answering the earlier question]

5. (15 pts.) Consider the following Java fragment from a recent class exercise:

```
1     public static int search(int[] haystack, int needle) {
2         int lo = 0;
3         int hi = haystack.length - 1;
4         while(lo + 1 < hi) {
5             int mid = (lo + hi) / 2;
6             if(haystack[mid] > needle) hi = mid;
7             else if (haystack[mid] < needle) lo = mid;
8             else return mid;
9         }
10        for(int i = lo; i <= hi; i++) {
11            if(haystack[i] == needle) return i;
12        }
13        return -1;
14    }
```

- (a) State a recurrence equation for  $T(n)$ , the running time of the above code as a function of  $n$ , the length of the `haystack` array.
- (b) Explain why the above recurrence is correct.
- (c) Solve the recurrence using one of the methods in the textbook. (State the method and show its key steps.)

[additional space for answering the earlier question]

6. (10 pts.) Depict the *first three levels* of the recursion tree that outlines the recursive calls made by the FIND-MAXIMUM-SUBARRAY algorithm when invoked on the following array, with `low` and `high` equal to 1 and 10, respectively.

The *nodes* of the tree should be labeled with the function invoked: FIND-MAXIMUM-SUBARRAY ( $M$ ) or FIND-MAX-CROSSING-SUBARRAY ( $X$ ).

The *edges* should connect each function's node (child) to the node of its invoker (parent).

|       |    |    |     |     |    |    |   |     |     |    |
|-------|----|----|-----|-----|----|----|---|-----|-----|----|
| i:    | 1  | 2  | 3   | 4   | 5  | 6  | 7 | 8   | 9   | 10 |
| A[i]: | 88 | -1 | -11 | -23 | 43 | -6 | 8 | -19 | -58 | 50 |
